Package 'RchivalTag'

April 13, 2021

Type Package

Title Analyzing and Interactive Visualization of Archival Tagging Data

Version 0.1.5

Date 2021-03-25

Author Robert Bauer

Maintainer Robert Bauer <marine.biologging@gmail.com>

Description A set of functions to generate, access and analyze standard data products from archival tagging data.

Depends R (>= 3.5.0), maps, mapdata

Imports plyr, maptools, graphics, stats, raster, readr, rgeos, ncdf4, pracma, dygraphs, xts, lubridate, shiny, htmlwidgets, grDevices, oceanmap, sp, methods, PBSmapping, ggplot2, ggedit, plotly, leaflet, leaflet.extras2, sf

License GPL (>= 3)

LazyLoad yes

Repository CRAN

bin_TempTS   *bin depth-temperature time series data*

Description

bins depth-temperature time series data to a user-defined resolution, returning the minimum, maxmium
and average temperature recorded at each depth interval (bin) per sampling day. The output is com-
parable to that of read_PDT.

Why binning temperature data?
In case of archival tagging data, depth-temperature time series data at a given day may consist of
multiple tempertaure profiles of different signatures, depending on the animal's behaviour. Slight
differences in temperature profiles could impede further analyses (e.g. the estimation of the thermo-
cline depth), if just the average profile is applied. To avoid such problmes, it is useful to calculate
the average temperature at given depth intervals (bins) and thus smooth temperature profiles of a
given period.

In addition, temperature at depth profiles can be interpolated and then visualized using functions in-
terpolate_TempDepthProfiles and image_TempDepthProfiles, respectively. This faciliates the anal-
ysis of temporal changes of temperature profiles, for instance, in relation to animal behaviour (e.g.
diving behaviour).

Usage

```
bin_TempTS(ts, res=8)
```

Arguments

ts   a data.frame with columns date, Depth and Temperature

res   the depth interval at which temperatures should be binned.

Value

A [data.frame](#) with the columns date, MeanTemp, MinTemp, MaxTemp, bin and MeanPDT (the latter being the average of the min and maximum water temperatures). Additional columns, used to distinguish tags, may include Serial, DeployID and Ptt, depending on their availability in the original ts-data.fralme.

Examples

```
# #### example 1) run on time series data:
## step I) read sample time series data file:
DepthTempTS <- read.table(system.file("example_files/104659-Series.csv",
                                    package="RchivalTag"),header = TRUE,sep=',')
DepthTempTS$date <- as.Date(DepthTempTS$Day,"%d-%b-%Y")
head(DepthTempTS)
#
#
# ## step Ib) bin temperature data on 10m depth bins
# ##          to increase later estimate accuracy (see Bauer et al. 2015):
# # DepthTempTS_binned <- bin_TempTS(DepthTempTS,res=10)
#
# ## step II) interpolate average temperature fields (MeanTemp) from binned data:
# m <- interpolate_TempDepthProfiles(DepthTempTS)
# # m <- interpolate_PDTs(DepthTempTS_binned)
# str(m)
# m$sm
#
# ## step III) calculate thermal stratifcation indicators per day (and tag):
# get_thermalstrat(m, all_info = TRUE)
# get_thermalstrat(m, all_info = FALSE)
#
# ## step IV) plot interpolated profiles:
# image_TempDepthProfiles(m$station.1)
```

classify_DayTime   *Classifying the time period of the day*

Description

Classifying the time period of the day based on the timing of sunrise, sunset (and twilight events) or alternatively, geolocation estimates, as specified in get_DayTimeLimits, that allow their internal estimation during the function call.

Usage

```
classify_DayTime(pos, twilight.set="ast")
```

Arguments

pos
: A data.frame pos with the columns sunrise, sunset, dawn.ast,/dawn.naut and dawn.ast/dawn.naut in POSIXct-format. Note that the expected twilight vector (suffix "ast" for astronomical dawn and dusks; vs suffix "naut" for nautical twilight events) is defined by the function's second argument twilight.set (see description below).

twilight.set
: character string, indicating the type of twilight used for the long daytime classification: "ast" (default) for astronomical and "naut" for nautical twilight events with sun angles of 18 vs 12 below the horizon, respectvely. Corresponding (expected) dawn and dusk vector names are dawn.ast & dusk.ast vs dawn.naut & dusk.naut).

Value

The input data.frame pos extended by the time vectors daytime and daytime.long. In the former case, "Day" and "Night" periods are distinguished. In the latter case, "Day", "Night", "Dawn" and "Dusk".

ts_df2 <- classify_DayTime(get_DayTimeLimits(ts_df)) # estimate daytime
head(ts_df2)

ts2histos(ts_df2, tad_breaks = tad_breaks,split_by = "daytime")
hist_tad(ts_df2, bin_breaks = tad_breaks,split_by = "daytime", do_mid.ticks = FALSE)
```

---

combine_histos	*combine lists of TAD/TAT frequency data*

Description

This function allows to combine seperate lists of TAD/TAT frequency data from archival tags (i.e. by Wildlife Computers). The function requires ungrouped/unmerged TAD/TAT lists to avoid merging duplicate records (e.g. multiple TAD/TAT lists from the same individual). However, grouped/merged lists with TAD/TAT from multiple individuals and even duplicate records can be provided, as the function includes an internal call of unmerge_histos to meet this requirement.

Usage

```
combine_histos(hist_list1, hist_list2)
```

Arguments

hist_list1, hist_list2

> Two list-of-lists to be combined, each containing TAD and TAT frequency data and the corresponding bin_breaks from one or several archival tags.

Value

A list-of-lists of ungrouped/unmerged TAD and TAT frequency data.

$ TAD:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
$ TAT:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
..$ ID2 : List of 2
...

dy_DepthTS   *plot time series data via the dygraphs interactive time series plotting*
                           interface.

Description

plot time series data (e.g. depth or temperature time series data from archival tags) via the dygraphs
interactive time series plotting interface.

Usage

```
dy_TS(ts_df, y="Depth", xlim, ylim,
           ylab=y, xlab="Time (UTC)", main,
           ID, ID_label="Serial",
           plot_DayTimePeriods=TRUE, twilight.set="ast",
           color="darkblue",
           doRangeSelector=TRUE, drawPoints=FALSE, pointSize=2, ...)

dy_DepthTS(ts_df, y="Depth", xlim, ylim,
           ylab=y, xlab="Time (UTC)", main,
           ID, ID_label="Serial",
           plot_DayTimePeriods=TRUE, twilight.set="ast",
           color="darkblue",
           doRangeSelector=TRUE, drawPoints=FALSE, pointSize=2, ...)
```

Arguments

ts_df	[data.frame](#) holding the time series data to be plotted, including the x-vector 'datetime' (in POSIXct-format and UTC), and the numeric y-vector whose label is defined by y.
y	character label of time series vector to be plotted (by default 'Depth').
xlim	the x limits (x1, x2) of the plot (by default range(ts_df$datetime), but needs to be specified in empty.plot_TS).
ylim	the y limits of the plot (by default range(ts_df[[y]]), but needs to be specified in empty.plot_TS).
ylab, xlab	the y- and x-axis labels.
main	main title (by default "Tag ID") for the plot).
ID, ID_label	Tag ID and its label (column name; by default "Serial") to be selected (e.g. if input data frame holds tagging data from several tags).
plot_DayTimePeriods, twilight.set	
	whether day-time periods ('Night', 'Dawn', 'Day', 'Dusk') should be plotted as shaded areas. In case that plot_DayTimePeriods is set TRUE), the limits of each time period are required (columns sunrise, sunset, dawn.ast,/dawn.naut and

dawn.ast/dawn.naut in POSIXct-format. In case of the twilight events, the additional argument twilight.set defines the suffix of the twlight-set to be selected ("ast" for astronomical dawn and dusks vs "naut" for nautical twilight events). If any of the day-time columns, described above, is missing, it/they will be calculated based on geolocation estimates (required columns Lon and Lat) through an internal call of function get_DayTimeLimits.

color   color of the line to be plotted (by default "darkblue")

doRangeSelector

whether to add dygraph interactive range selection and zooming bar below the figure (by default TRUE)

drawPoints, pointSize

Whether to indicate add points to the figure at the sampling time steps as well their size.

...   additional arguments to be passed to [dygraph](#).Further arguments can be passed after the function call, e.g. via [dyOptions](#).

Value

An interactive dygraph plot object that can be altered further using for exemple the [dyOptions](#).

get_DayTimeLimits   *Estimating the timing of sunrise, sunset, astronomical and nautical twilight events*

Description

Estimating the timing of sunrise, sunset, astronomical and nautical twilight events in POSIXct-format based on geolocations and a similar time vector. The function is a simplified call of the [sunriset](#) and [crepuscule](#) functions of the maptools-package that are based on algorithms provided by the National Oceanic & Atmospheric Administration (NOAA).

Usage

```
get_DayTimeLimits(pos)
```

Arguments

pos   a [data.frame](#) with the columns datetime (a time vector in POSIXct-format), Lon and Lat.

Value

The input [data.frame](#) pos extended by the time vectors sunrise, sunset, dawn.naut, dawn.ast, dusk.naut and dusk.ast.

Author(s)

Robert K. Bauer

References

Meeus, J. (1991) Astronomical Algorithms. Willmann-Bell, Inc.

get_thermalstrat *estimate thermal stratification indices*

Description

estimates thermal stratification indices, including thermocline depth, gradient, mixed later depth and stratifcation index from daily temperature at depth profiles, as illustrated by Bauer et al. (2015) for archival tagging data.

Usage

```
get_thermalstrat(x, dz=20, strat_lim=100, na.rm=FALSE,
                 show_info=TRUE, Depth_res, all_info=FALSE)
```

Arguments

x   A list generated by interpolate_TempDepthProfiles, containing interpolated tem-
                perature at depth profiles and their corresponding date and depth vectors:
                $ Data_Source.ID_key:List of 3
                ..$ Temperature_matrix: num
                ..$ Depth : num
                ..$ Date :Date
                ..$ sm :data.frame
                .. ..$ Date :chr
                .. ..$ nrecs :int
                .. ..$ Depths :chr

dz   size of the moving window in meters between which temperature values should
                be compared for the estimation of the thermocline gradient and depth (by default
                20).

na.rm   whether interpolated temperature at depth profiles with missing values should
                be treated (default is FALSE).

strat_lim   up to which depth (in meters) temperature values should be considered for the
                estimation of the stratication index (by default 100).

Depth_res	numeric value, defining the depth resolution at which the temperature data should be interpolated.
show_info	whether the process of the function run should be indicated (by default TRUE).
all_info	whether the summary information of the input file should be generated in the output (by default FALSE).

Value

a [data.frame](#) composed of

Date a date vector (see input argument x)

maxDepth_interp the maxmium depth (in meters) of a daily temperature at depth profile to which its interpolation is limitied)

tgrad the maximum temperature gradient of all possible moving windows of size dz)

tcline the thermocline depth, defined as the average depth (of the depth range) of the moving window(s) with the maximum temperature gradient tgrad)

dz size of the moving window in meters between which temperature values were compared

mld mixed layer depth, defined as the average depth of the first moving window that meets maximum temperature gradient criterium)

mld_0.5 mixed layer depth, defined as as the depth at which T = SST-0.5 degrees, the temperature criterion of Monterey and Levitus (1997).

mld_0.8 mixed layer depth, defined as the depth at which T = SST-0.8 degrees, the temperature criterion of Kara et al. (2000, 2003).

strat_index stratification index, defined as the standard deviation of all interpolated temperature values up to the depth defined by the argument strat_lim

... optional columns to be taken from the sm data.frame of the input list (in case that all_info=TRUE)

  nrecs number of records of the non-interpolated daily temperature at depth profiles

  Depths unique depth records of the non-interpolated daily temperature at depth profiles, seperated by '; '

ggboxplot_DepthTS_by_hour

Boxplot on hourly aggregated DepthTS records

Description

This function creates a boxplot via the ggplot library from hourly aggregated DepthTS records

Usage

```
ggboxplot_DepthTS_by_hour(ts_df, ylim, min_perc=75,
                          main="", submain,
                          ID, ID_label="Serial",
                          plot_DayTimePeriods=TRUE, twilight.set="ast",
                          box=TRUE, jitter=FALSE,
                          color_by=ID_label, cb.title=color_by,
                          pal, opacity=0.1)
```

Arguments

`ts_df`	`data.frame` with DepthTS data,
`ylim`	limits of the y-axis.
`min_perc`	the minimum data coverage (in percent) of daily DepthTS recoords (by default 75%).
`main, submain`	The title and subtitle of the figure.
`ID, ID_label`	Tag ID and its label (column name; by default "Serial") to be selected (e.g. if input data frame holds tagging data from several tags).
`plot_DayTimePeriods, twilight.set`	
	whether day-time periods ('Night', 'Dawn', 'Day', 'Dusk') should be plotted as shaded areas. In case that `plot_DayTimePeriods` is set TRUE), the limits of each time period are required (columns `sunrise`, `sunset`, `dawn.ast`,/`dawn.naut` and `dawn.ast/dawn.naut` in `POSIXct`-format. In case of the twilight events, the additional argument `twilight.set` defines the suffix of the twlight-set to be selected (`"ast"` for astronomical dawn and dusks vs `"naut"` for nautical twilight events).
`box`	whether to draw a box around the figure (by default TRUE)
`jitter, color_by, cb.title, pal, opacity`	
	whether to draw all Depth records on top of the boxplot (by default `FALSE`). If selected, records will be colored via the different groups in the column specified in `color_by` with colors specified by the color palette `pal` and the opacity value between 0 (transparent) and 1 (solid).

ggplotly_geopos   *Converts a ggplot2 object from ggplot_geopos() to plotly*

Description

This function converts a ggplot2 object created by RchivalTag::ggplot_geopos() to a plotly object.

Usage

```
ggplotly_geopos(ggobj, fixedrange=F, grid=F,expand=10)
```

Arguments

ggobj	Character string identifying regions predefined by the region_definitions-dataset, Raster* or Extent object (corresponds to v_area of the v-function). If missing, region is derived from geographical coordinates, denoted by lat and lon. See add.region to define new region definitions and delete.region to delete unproper region definitions.
fixedrange	Vector returning longitude coordinates of the area to be plotted.
grid	whether a grid should be plotted (default is TRUE)
expand	By default, the underlying ggplotly-function does not stick to the plotting region of the ggobj, but extends it. This can result in missing countries or islands. The expand-argument extends the plotly-plotting window in each direction in order to cover the corresponding landmasks.)

Details

ggoplotmaply uses the `ggplotly` functions to convert the ggplot object into the plotly format.

#
#
# ## example 3) probability surfaces of horizontal tracks from kmz-file:
# kmz_file <- system.file("example_files/15P1019-104659-1-GPE3.kmz",package="RchivalTag")
# ggobj7 <- ggplot_geopos(kmz_file)
# ggobj7
# ggplotly_geopos(ggobj7)
#
#
# kmz_file2 <- system.file("example_files/15P0986-15P0986-2-GPE3.kmz",package="RchivalTag")
# ggobj8 <- ggplot_geopos(kmz_file)
# ggobj8
# ggplotly_geopos(ggobj8)
#
# ## example 4) combine polygon tracks:
# k1 = get_geopos(kmz_file)
# k2 = get_geopos(kmz_file2)
#
# ggobj <- ggplotmap("mednw4")
# ## p1 <- ggplot_geopos(k1,ggobj = ggobj) ## not working, need to change date format:
# p1 <- ggplot_geopos(k1,date_format = "%d-%b-%Y %H:%M:%S")
# p1
# p2 <- ggplot_geopos(k2,p1,zlim = as.Date(range(c(k1$datetime,k2$datetime))),
#       date_format = "%d-%b-%Y %H:%M:%S")
# ggplotly_geopos(p2)
#
# ## change plot window:
# p1b <- ggplot_geopos(k1,ggobj = ggobj, date_format = "%d-%b-%Y %H:%M:%S")
# p2b <- ggplot_geopos(k2,p1b,zlim = as.Date(range(c(k1$datetime,k2$datetime))),
#                      date_format = "%d-%b-%Y %H:%M:%S")
# p2b
# ggplotly_geopos(p2b)
```

---

ggplot_geopos   *reads and plots geolocation estimates derived from archival tagging data*

Description

In case that geolocations are provided by csv-files or data frames, line and scatter plots are implemented. If ncdf-files or kmz-files, generated by the Wildlife Computers-data portal, are selected, a SpatialPolygonsDataFrame will be created and a surface probability maps are illustrated. The netcdf transformation procedure is based on the R-code given in the location processing user guide by Wildlife Computers. The kmz-files already include the contour lines of the 50, 95 and 99% likelihood areas that are being extracted and likewise transformed to a SpatialPolygonsDataFrame. In case of kmz-files, no other areas can be selected.

Usage

```
ggplot_geopos(x, ggobj, xlim, ylim, zlim, standard_year=FALSE,
              full_year=standard_year, date_format, lang_format="en", tz="UTC",
          Breaks, cb.title, cb.date_format, cbpos, cb.height = 10, cb.xlab = "",
        cb.reverse=FALSE, pal.reverse=cb.reverse, prob_lim=.75, color_by="date",
              pal, alpha=70, type="p",
              main ,lwd=1, size=2, shape=19, ...)

get_geopos(x, xlim, ylim, date_format, lang_format="en", tz="UTC",
           proj4string, prob_lim=.5,verbose=TRUE)
```

Arguments

x   data.frame containing horziontal position records (allowed column names are 'Most.Likely.Longitude', 'Longitude' or 'Lon' and 'Most.Likely.Latitude', 'Lat-itude' or 'Lat', respectively. path and file name of .csv, .kmz, .kml or .nc-files, or a loaded nc-file via get_geopos.

           Please note that netcdf- and kmz-file outputs from similiar probability thresholds (e.g. 0.50) may differ due to differences in the generation algorithm.

           Please also note that the kmz-files from WC include only a subsample (up to 50) of the GPE3 likelihood areas. The kmz-file transformation is very fast, but due to the limitation stated above, only recommended for display purposes. Please contact WC if you need the complete GPE3 likelihood areas or use the netcdf-file transformation.

ggobj   ggplot object.

xlim, ylim Numeric vector, defining the limts of the x and y-axes.

zlim, Breaks, standard_year,full_year

           date range and breaks of the colorbar. If standard_year is set TRUE, positions are standardized on a yearly basis and tick breaks are ignored. If full_year is set TRUE as well, the color scale will cover all months from January until December.

date_format, lang_format, tz

           character strings indicating the date format, language format and the corresponding time zone, defined by the vectors Date and Time (by default: date_format="%d-%b-%Y %H:%M:%S", lang_format="en", tz='UTC') If formatting fails, please check as well the input language format, defined by lang_format (and use ab-brviations such as "en" for English,"es" for Spanish, "fr" for French, etc.) as well.

proj4string Coordinate reference system (CRS; projection).

cb.title   character string indicating the title of the colorbar (by default 'Date'.)

cb.date_format character strings indicating the date format of the color bar ticks (by default "%Y-%m-%d").

cbpos, cb.xlab, cb.height

           position, xlab and height of the colorbar

prob_lim   in case that a kmz, kml, or netcdf-file (.nc) is selected, the value defines the limit of the probability surfaces in % (By default 0.50 for 50%). Note that in case of kmz, kml-files valid values are 0.50, 0.95 or 0.99). Otherwise ignored.

color_by	colomn or vector by which the geolocations should be colored (by default "date").
pal	color map to be plotted in case of polygon (.nc-files) or scatter plots (default is the 'jet'-colormap, and 'year.jet' in case standard_year & full_year are set TRUE). See [cmap](#) for pre-installed color maps. Note that tracking data with constant time steps is being assumed in the color assignment. To verify this, a [data.frame](#) containing the colors at each time steps will be returned for polygon and scatter plots.
cb.reverse, pal.reverse	
	inverse order of ticks and colormap of colorscale.
alpha	transparency of polygons and dots to be plotted in percent (By default 70%).
type	character string giving the type of plot desired. The following values are possible, for details (By default "p" for points, but "l" for lines is also implemented).
size, shape	size and dot-type (by default '19' for solid dots) of the points to be plotted (requires 'type' set to points or line-points).
lwd	line width
...	additional arguments to be passed to [ggplotmap](#).
main	an overall title for the plot
verbose	whether the file names should be printed during loading (By default TRUE).

hist_tad   *Time-at-Depth histogram*

Description

generates daily or back-to-back (e.g. Day-vs-Night-) Time-at-Depth histograms from binned depth
or depth time series data

Usage

```
hist_tad(df,
            bin_breaks=NULL, bin_prefix="Bin",
            select_id, select_from='Ptt', aggregate_by='Ptt',
            date, min_perc,
            main, xlab='Time at Depth (%)', ylab="Depth (m)", labeling=TRUE,
            xlim=c(0, 100), adaptive.xlim=FALSE,
            split_by=NULL, split_levels, xlab2=split_levels,
            ylab.side=2, ylab.line, ylab.font=1,
            xlab.side=3, xlab.line=2.5, xlab.font=1,
            xlab2.side=1, xlab2.line=1, xlab2.font=2,
            main.side=3, main.line=3.8, main.font=1,
            col=c("darkgrey", "white"),
            xticks, ylabels,
            do_mid.ticks=TRUE, yaxis.pos=0,
            mars, space=0,
            plot_sd=TRUE, plot_se, plot_nrec=TRUE, plot_ntags=TRUE,
            cex=1.2, cex.main=cex, cex.lab=cex, cex.inf=cex,cex.axis=1,
            return.sm=FALSE,
            subplot=FALSE, inside=FALSE,Type="TAD")
```

Arguments

df   dataframe that either contains depth time series data (as a vector "Depth") or
                          several vectors of Time-at-Depth frequencies. In the latter case, column names
                          composed of a common bin_prefix (default is "Bin.") hold the pre-binned
                          Time-at-Depth frequencies whose depth limits are defined in bin_breaks.

bin_breaks, bin_prefix

                          bin_breaks is a numeric vector of depth bin breaks for the histogram data.
                          In case of binned data (e.g. from standard wildlife computer histogram files),
                          column names with a bin_prefix are expected to contain the preprossesed data
                          (by default: Bin1, Bin2, Bin3, etc.). Alternatively, depth time series data will be
                          directly converted using function ts2histos.

select_id, select_from

> these arguments allow to take a direct subset of the input dataframe. `select_from` defines the vector whereas `select_id` defines the identification key(s) that should be selected.

aggregate_by   character vector defining the columns by which the tagging data should be aggregated. Should contain columns that identify tags (e.g. Serial, Ptt, DeployID) the date and/or day time period (to seperate records from night, day, dawn and dusk see [classify_DayTime](#)). Default values are: date, Day and Ptt.

date   An optional vector to select depth data of a specified date/-range.

min_perc   optional number, defining the minimum data coverage (in percent) of histogram entries obtained from depth time series data.

main, xlab, ylab, labeling

> The titles for the plot, x- and y-axes to be plotted if `labeling` is set `TRUE` (default).

xlim, adaptive.xlim

> a vector defining the limits (x1,x2) of the x-axis, by default c(0,100). However, if `adaptive.xlim` is set `TRUE`, these limits will be overwritten, and the maximum value (xlim[2]) will be chosen from the histogram data.

split_by   Name of the logical vector by which TaD data should be splitted (e.g. daytime; see [classify_DayTime](#)).

split_levels, xlab2

> Character vector defining the name and order of the levels of the split_by vector (e.g. c("Night", "Day") for split_by vector 'day.time'. The same groups are plotted as a second x-axis label if not defined otherwise (xlab2=split_levels).

ylab.side, ylab.line, ylab.font

> side, line and font of second y-axis label.

xlab.side, xlab.line, xlab.font

> side, line and font of first x-axis label.

xlab2.side, xlab2.line, xlab2.font

> side, line and font of second x-axis labels.

main.side, main.line, main.font

> side, line and font of plot title.

col   colours to be used for the TaD-histogram, by default 'grey' and 'white' (corresponding to the values of split_by/split_levels).

xticks, ylabels

> tick labels of the x-axis and ylabels of the y-axis to show in the plot.

do_mid.ticks   whether centered tick-labels, indicating the depth range of histogram cells, shall be plotted (by default `FALSE`). Alternatively, tick labels will be indicated at the breakpoints of the histrogram cells.

yaxis.pos   x-axis coordinate at which the y-axis should be plotted (by default xlim[1], and thus 0).

mars   a numerical vector of the form `c(bottom,left,top,right)`, decribing the number of margin lines to be specified on the each side of the plot. The default is `c(2.1,4.1,6.1,2.1)`. In case that `do_mid.ticks` is `TRUE` margins are: `c(2.1,8,6.1,2.1)`.

space   the space between the histogram bars.

`plot_sd, plot_se, plot_nrec , plot_ntags`

>   whether standard deviation or standard error bars, the number of records and tags shall be plotted (default is TRUE) inside the TaD/TaT histogram. (if plot_se is TRUE, plot_sd will be overwritten!).

`cex, cex.main, cex.lab, cex.inf, cex.axis`

>   font size of the title (`cex.main`), x- and y-axes labels (`cex.lab`), other labels, like the number of records (`cex.inf`) as well as of the tick marks.

`return.sm`   whether summary information of the TaD histograms, including the number of records per summary period, the relative frequencies per bin and corresponding standard deviation, should be plotted (default is TRUE).

`subplot, inside`

>   whether the TaD histogram is a subplot or an inner plot of a figure (default is FALSE). If `subplot` or `inside` are set TRUE, graphic margins will not be set by `hist_tad`. In case that `inside` is TRUE, no axis-labels and titels wil be plotted.

`Type`   The Type of data to be plotted (`TAD`: Time-at-Depth histograms; `TAT`: Time-at-Temperature histograms)

Details

Time-at-Temperature (Tat) and Time-at-Depth (TaD) fequencies are a standard data product of archival tags (incl. tag models TDR-Mk9, PAT-Mk10 and miniPAT by Wildlife Computers) that allow to assess habitat preferences of tagged animals (see function read_histos). It can be likewise generated from transmitted or recovered time series data sets using function ts2histos.

However, different depth and temperature bin breaks are often used during different deployment programs, which makes a later comparitive analysis of TaT and TaT data difficult. For such cases, the function combine_histos and merge_histos can be applied to merge TaT and TaD frequencies based on common bin breaks of different tags.

The purpose of this function is the visualization of Time-at-Depth (TaD) histograms, whereas hist_tad is the related function for Time-at-Temperature (TaT) data.

Examples

```
ts_file <- system.file("example_files/104659-Series.csv",package="RchivalTag")
ts_df <- read_TS(ts_file)
head(ts_df)

tad_breaks <- c(0, 2, 5, 10, 20, 50, 100, 200, 300, 400, 600, 2000)
tat_breaks <- c(10,12,15,17,18,19,20,21,22,23,24,27)

## example 1a) convert only DepthTS data to daily TAD frequencies:
ts2histos(ts_df, tad_breaks = tad_breaks)
```

```
hist_tad(ts_df, bin_breaks = tad_breaks)
hist_tad(ts_df, bin_breaks = tad_breaks, do_mid.ticks = FALSE)

## convert 1b) only TemperatureTS data to daily TAT frequencies:
tat <- ts2histos(ts_df, tat_breaks = tat_breaks)
hist_tat(ts_df, bin_breaks = tat_breaks, do_mid.ticks = FALSE)
hist_tat(tat$TAT$merged, do_mid.ticks = FALSE)

## convert 1c) DepthTS & TemperatureTS data to daily TAD & TAT frequencies:
ts2histos(ts_df, tad_breaks = tad_breaks, tat_breaks = tat_breaks)

## convert 1d) back-to-back histogram showing day vs night TAD frequencies:
ts_df$Lat <- 4; ts_df$Lon=42.5 ## required geolocations to estimate daytime
head(ts_df)
ts_df2 <- classify_DayTime(get_DayTimeLimits(ts_df)) # estimate daytime
head(ts_df2)

ts2histos(ts_df2, tad_breaks = tad_breaks,split_by = "daytime")
hist_tad(ts_df2, bin_breaks = tad_breaks,split_by = "daytime", do_mid.ticks = FALSE)

## example 2) rebin daily TAD frequencies:
tad <- ts2histos(ts_df, tad_breaks = tad_breaks)
tad2 <- rebin_histos(hist_list = tad, tad_breaks = tad_breaks[c(1:3,6:12)])
par(mfrow=c(2,2))
hist_tad(tad, do_mid.ticks = FALSE) ## example for multiple individuals
hist_tad(tad$TAD$merged, do_mid.ticks = FALSE)
hist_tad(tad$TAD$merged, bin_breaks = tad_breaks[c(1:3,6:12)]) ## from inside hist_tad

## example 3) read, merge and plot TAD frequency data from several files:
## part I - read histogram data from two files:
hist_dat_1 <- read_histos(system.file("example_files/104659-Histos.csv",package="RchivalTag"))
hist_dat_2 <- read_histos(system.file("example_files/104659b-Histos.csv",package="RchivalTag"))
## note the second list is based on the same data (tag), but on different bin_breaks

## part II - combine TAD/TAT frecuency data from seperate files in one list:
hist_dat_combined <- combine_histos(hist_dat_1, hist_dat_2)
par(mfrow=c(2,1))
hist_tad(hist_dat_combined)
hist_tat(hist_dat_combined)

## part III - force merge TAD/TAT frecuency data from seperate files
# in one list, by applying common bin_breaks:
hist_dat_merged <- merge_histos(hist_dat_combined,force_merge = TRUE)
hist_tad(hist_dat_merged)
hist_tat(hist_dat_merged)

## part IV - plot merged data:
hist_tad(hist_dat_merged) # of all tags
unique(hist_dat_merged$TAD$merged$df$DeployID) ## list unique tags in merged list
hist_tad(hist_dat_merged, select_id = "15P1019b", select_from = 'DeployID') # of one tag
```

```
## part V - unmerge data:
unmerge_histos(hist_dat_merged)
```

---

hist_tat   *Time-at-Temperature histogram*

Description

generates daily or back-to-back (e.g. Day-vs-Night-) Time-at-Temperature histograms from binned
Temperature or Temperature time series data

Usage

```
hist_tat(df,
              bin_breaks=NULL, bin_prefix="Bin",
              main, xlab="Time at Temperature (%)",
              ylab=expression(paste("Temperature (",degree,"C)")), labeling=TRUE,
              Type="TAT", ...)
```

Arguments

df	dataframe that either contains Temperature time series data (as a vector "Temperature") or several vectors of Time-at-Temperature frequencies. In the latter case, vector names are composed of a common `bin_prefix` (default is "tad."), followed by the upper Temperature limit (bin break).
bin_breaks, bin_prefix	
	`bin_breaks` is a numeric vector of depth bin breaks for the histogram data. In case of binned data (e.g. from standard wildlife computer histogram files), column names with a `bin_prefix` are expected to contain the preprossesed data (by default: Bin1, Bin2, Bin3, etc.). Alternatively, depth time series data will be directly converted using function ts2histos.
main, xlab, ylab, labeling	
	The titles for the plot, x- and y-axes to be plotted if `labeling` is set TRUE (default).
Type	The Type of data to be plotted (`TAD`: Time-at-Depth histograms; `TAT`: Time-at-Temperature histograms)
...	additional arguments to be passed:

    select_id, select_from these arguments allow to take a direct subset of the input dataframe. `select_from` defines the vector whereas `select_id` defines the identification key(s) that should be selected.

    aggregate_by character vector defining the columns by which the tagging data should be aggregated. Should contain columns that identify tags (e.g. Serial, Ptt, DeployID) the date and/or day time period (to seperate records from night, day, dawn and dusk see classify_DayTime). Default values are: date, Day and Ptt.

    date An optional vector to select depth data of a specified date/-range.

xlim, adaptive.xlim a vector defining the limits (x1,x2) of the x-axis, by default c(0,100). However, if adaptive.xlim is set TRUE, these limits will be overwritten, and the maximum value (xlim[2]) will be chosen from the histogram data.

split_by Name of the logical vector by which TaD data should be splitted (e.g. daytime; see classify_DayTime).

split_levels, xlab2 Character vector defining the name and order of the levels of the split_by vector (e.g. c("Night", "Day") for split_by vector 'day.time'. The same groups are plotted as a second x-axis label if not defined otherwise (xlab2=split_levels).

ylab.side, ylab.line, ylab.font side, line and font of second y-axis label.

xlab.side, xlab.line, xlab.font side, line and font of first x-axis label.

xlab2.side, xlab2.line, xlab2.font side, line and font of second x-axis labels.

main.side, main.line, main.font side, line and font of plot title.

col colours to be used for the TaD-histogram, by default 'grey' and 'white' (corresponding to the values of split_by/split_levels).

xticks, ylabels tick labels of the x-axis and ylabels of the y-axis to show in the plot.

do_mid.ticks whether centered tick-labels, indicating the depth range of histogram cells, shall be plotted (by default FALSE). Alternatively, tick labels will be indicated at the breakpoints of the histrogram cells.

yaxis.pos x-axis coordinate at which the y-axis should be plotted (by default xlim[1], and thus 0).

mars a numerical vector of the form c(bottom,left,top,right), decribing the number of margin lines to be specified on the each side of the plot. The default is c(2.1,4.1,6.1,2.1). In case that do_mid.ticks is TRUE margins are: c(2.1,8,6.1,2.1).

space the space between the histogram bars.

plot_sd, plot_se, plot_nrec , plot_ntags whether standard deviation or standard error bars, the number of records and tags shall be plotted (default is TRUE) inside the TaD/TaT histogram. (if plot_se is TRUE, plot_sd will be overwritten!).

cex, cex.main, cex.lab, cex.inf font size of the title (cex.main), x- and y-axes labels (cex.lab), and other labels, like the number of records (cex.inf).

return.sm whether summary information of the TaD histograms, including the number of records per summary period, the relative frequencies per bin and corresponding standard deviation, should be plotted (default is TRUE).

subplot, inside whether the TaD histogram is a subplot or an inner plot of a figure (default is FALSE). If subplot or inside are set TRUE, graphic margins will not be set by hist_tat. In case that inside is TRUE, no axis-labels and titels wil be plotted.

Details

Time-at-Temperature (Tat) and Time-at-Depth (TaD) fequencies are a standard data product of archival tags (incl. tag models TDR-Mk9, PAT-Mk10 and miniPAT by Wildlife Computers) that

allow to assess habitat preferences of tagged animals (see function read_histos). It can be likewise generated from transmitted or recovered time series data sets using function ts2histos.

However, different depth and temperature bin breaks are often used during different deployment programs, which makes a later comparitive analysis of TaT and TaT data difficult. For such cases, the function combine_histos and merge_histos can be applied to merge TaT and TaD frequencies based on common bin breaks of different tags.

The purpose of this function is the visualization of Time-at-Temperature (TaT) histograms, whereas hist_tad is the related function for Time-at-Depth (TaD) data.

Examples

```
ts_file <- system.file("example_files/104659-Series.csv",package="RchivalTag")
ts_df <- read_TS(ts_file)
head(ts_df)

tad_breaks <- c(0, 2, 5, 10, 20, 50, 100, 200, 300, 400, 600, 2000)
tat_breaks <- c(10,12,15,17,18,19,20,21,22,23,24,27)

## example 1a) convert only DepthTS data to daily TAD frequencies:
ts2histos(ts_df, tad_breaks = tad_breaks)
# hist_tad(ts_df, bin_breaks = tad_breaks)
hist_tad(ts_df, bin_breaks = tad_breaks, do_mid.ticks = FALSE)

## convert 1b) only TemperatureTS data to daily TAT frequencies:
tat <- ts2histos(ts_df, tat_breaks = tat_breaks)
hist_tat(ts_df, bin_breaks = tat_breaks, do_mid.ticks = FALSE)
hist_tat(tat$TAT$merged, do_mid.ticks = FALSE)

## convert 1c) DepthTS & TemperatureTS data to daily TAD & TAT frequencies:
ts2histos(ts_df, tad_breaks = tad_breaks, tat_breaks = tat_breaks)

## convert 1d) back-to-back histogram showing day vs night TAD frequencies:
ts_df$Lat <- 4; ts_df$Lon=42.5 ## required geolocations to estimate daytime
head(ts_df)
ts_df2 <- classify_DayTime(get_DayTimeLimits(ts_df)) # estimate daytime
head(ts_df2)

ts2histos(ts_df2, tad_breaks = tad_breaks,split_by = "daytime")
hist_tad(ts_df2, bin_breaks = tad_breaks,split_by = "daytime", do_mid.ticks = FALSE)

## example 2) rebin daily TAD frequencies:
tad <- ts2histos(ts_df, tad_breaks = tad_breaks)
```

```
tad2 <- rebin_histos(hist_list = tad, tad_breaks = tad_breaks[c(1:3,6:12)])
par(mfrow=c(2,2))
hist_tad(tad, do_mid.ticks = FALSE) ## example for multiple individuals
hist_tad(tad$TAD$merged, do_mid.ticks = FALSE)
hist_tad(tad$TAD$merged, bin_breaks = tad_breaks[c(1:3,6:12)]) ## from inside hist_tad

## example 3) read, merge and plot TAD frequency data from several files:
## part I - read histogram data from two files:
hist_dat_1 <- read_histos(system.file("example_files/104659-Histos.csv",package="RchivalTag"))
hist_dat_2 <- read_histos(system.file("example_files/104659b-Histos.csv",package="RchivalTag"))
## note the second list is based on the same data (tag), but on different bin_breaks

## part II - combine TAD/TAT frecuency data from seperate files in one list:
hist_dat_combined <- combine_histos(hist_dat_1, hist_dat_2)
par(mfrow=c(2,1))
hist_tad(hist_dat_combined)
hist_tat(hist_dat_combined)

## part III - force merge TAD/TAT frecuency data from seperate files
# in one list, by applying common bin_breaks:
hist_dat_merged <- merge_histos(hist_dat_combined,force_merge = TRUE)
hist_tad(hist_dat_merged)
hist_tat(hist_dat_merged)

## part IV - plot merged data:
hist_tad(hist_dat_merged) # of all tags
unique(hist_dat_merged$TAD$merged$df$DeployID) ## list unique tags in merged list
hist_tad(hist_dat_merged, select_id = "15P1019b", select_from = 'DeployID') # of one tag

## part V - unmerge data:
unmerge_histos(hist_dat_merged)
```

---

image_TempDepthProfiles

plots interpolated daily temperature at depth profiles

Description

plots interpolated daily temperature at depth profiles, thus faciliating the analysis of temporal changes of temperature profiles, for instance, in relation to animal behaviour (e.g. diving behaviour). See Bauer et al. (2015) for further examples.

Usage

```
image_TempDepthProfiles(x, main=NULL, xlab='Date', ylab="Depth (m)",
                        cb.xlab=expression(paste("Temperature (",degree,"C)")),
                        cex.cb.xlab=1, cex.cb.ticks=1,
                        xlim, ylim, zlim, pal="jet", only.months, month.line=0,
                        mars, axes=TRUE, do.colorbar=TRUE, ...)
```

Arguments

x   A list , generated by interpolate_TempDepthProfiles or interpolate_PDTs, containing interpolated temperature at depth profiles and their corresponding date and interpolated depth values as well as a summary table with the original depth values and their number per day:

$ Temperature_matrix: num
$ Depth : num
$ Date :Date
$ sm :data.frame

main, xlab, ylab

the title, x- and y-axis labels to be plotted.

cb.xlab   character string indicating the x-axis label of the colorbar.

cex.cb.xlab, cex.cb.ticks

cex.cb.xlab: font size of the x-axis label of the colorbar (by default 1). *cex.cb.ticks*: font size of the x-axis tick labels of the colorbar (by default 1).

xlim, ylim, zlim

the x, y and z limits of the plot.

pal   color map to be plotted (default is 'jet'). See cmap for available color maps.

only.months, month.line

whether only mid-months shall be plotted as tick labels of the x-axis (by default FALSE for time ranges of less than 3 months (93 days)). In case, that only.months is set TRUE, month.line defines the line where the month labels shall be plotted.

mars   a numerical vector defining the plot margins c(bottom,left,top,right) (by default c(5,4,4,9)).

axes, do.colorbar

whether the axes and colorbar should be plotted.

...   additional arguments to be passed to set.colorbarp

#
# ## step IV) plot interpolated profiles:
# image_TempDepthProfiles(m$station.1)
```

interpolate_TempDepthProfiles

interpolate daily temperature at depth profiles

Description

interpolates depth-temperature data and returns daily average temperature at depth profiles on a user-specified resolution (Depth_res).
Results are returned as a list containing the interpolated Temperature-matrix, and the corresponding date and depth values. Thus interpolated temperature at depth profiles can be visualized using function image_TempDepthProfiles and faciliates the analysis of temporal changes of temperature profiles, for instance, in relation to animal behaviour (e.g. diving behaviour).

Usage

```
interpolate_TempDepthProfiles(ts, Temp_field="Temperature", ID_key="Serial",
                         Depth_res=.5, show_info=TRUE, Data_Source='station')

interpolate_PDTs(ts, Temp_field="MeanPDT", ID_key="Serial", #return_as_matrix=FALSE,
                         Depth_res=.5, show_info=TRUE, Data_Source='station')
```

Arguments

ts, Temp_field, ID_key

> ts is a data.frame with temperature at depth data. Required columns are Depth for the depth data and a column containing temperature data, whose name is defined by Temp_field. ID_key specifies the name of an optional column on which sampling stations or tags can be distinguished (by default Serial).

Depth_res   numeric value, defining the depth resolution at which the temperature data should be interpolated.

show_info   whether the sampling dates and ids of stations or tags, as defined by the columns date and ID_key, should be indicated during the interpolation process.

Data_Source   a character string, defining the data source (by default station).

Value

A list containing the interpolated temperature at depth profiles and their corresponding date and interpolated depth values as well as a summary table with the original depth values and their number per day:

$ Data_Source.ID_key:List of 4
..$ Temperature_matrix: num
..$ Depth : num
..$ Date :Date
..$ sm :data.frame

Please see the examples for further understaning.

```

leaflet_geopos	*reads and plots geolocation estimates derived from archival tagging data*

Description

This function creates a Leaflet map widget using htmlwidgets from spatial tagging data. The widget can be rendered on HTML pages generated from R Markdown, Shiny, or other applications.

Usage

```
leaflet_geopos(data, ID_label, add_label=NULL, except_label=NULL,
               collapsedLayers=TRUE, radius=1000, pal,
               layer_title=ID_label, cb.title="Date",cbpos="bottomright",
               showScaleBar=TRUE, showSlideBar=FALSE)
```

Arguments

data	spatial data such as [data.frame](#) or [SpatialPolygonsDataFrame.](#)
ID_label	Vector in spatial data that defines the ID of the tracks to be plotted.
add_label, except_label	
	additional labels or labels to be removed from hover.
collapsedLayers	
	whether to collapse leaflet layer legend.
radius	circle size, in case of simple Lon/Lat tracking dataframes.
pal	color map to be plotted in case of polygon (.nc-files) or scatter plots (default is the 'jet'-colormap, and 'year.jet' in case standard_year & full_year are set TRUE). See [cmap](#) for pre-installed color maps. Note that tracking data with constant time steps is being assumed in the color assignment. To verify this, a [data.frame](#) containing the colors at each time steps will be returned for polygon and scatter plots.
layer_title	character string indicating the title of the layer legend (by default defined by 'ID_label'.)
cb.title	character string indicating the title of the colorbar (by default 'Date'.)
cbpos	position of the colorbar (by default 'bottomright'.)
showScaleBar, showSlideBar	
	whether to show the scale bar or the slide bar.

merge_histos	*merge and/or rebin TAD/TAT-frequency data*

Description

The joint analysis of archival tagging data from different tagging programs is often hampered by differences in the tags' setups, e.g. by the user-specified temporal resolution of time series data or the definition of summary data products. The latter particuarly concerns different selected bin breaks of Time-at-Depth (TAD) and Time-at-Temperature (TAT) frequency data from archival tags by Wildlife Computers.

The purpose of this function is to allow:

1) a grouping of TAD and TAT data from multiple tags based on similiar bin breaks (For this, run the function with default statements, i.e. force_merge is FALSE),

2) merging (rebinning) of TAD and TAT data from multiple tags based on the bin breaks that all tags have in common (To do so, run the function with force_merge set TRUE).

3) merging (rebinning) of TAD and TAT data from multiple tags based on new user-specified tad_breaks and/or tat_breaks. In this case, the force_merge-statements TRUE and FALSE will omit or seperately group tags that do not share all user-specified bin breaks, respectively.

To combine of TAD/TAT data of several hist_lists, see combine_histos.

To visualize Time-at-Temperature (TaT) and Time-at-Depth (TaD) data, please see hist_tat and hist_tad, respectively.

Usage

```
merge_histos(hist_list, tad_breaks=NULL, tat_breaks=NULL, force_merge=FALSE)
rebin_histos(hist_list, tad_breaks=NULL, tat_breaks=NULL, force_merge=FALSE)
```

Arguments

hist_list	A list-of-lists containing the TAD and TAT frequency data and the corresponding bin_breaks from one or several tags.
tad_breaks	a numeric vector defining the bin_breaks for the merging (rebinning) of the TAD frequency data. In case that the additional argument force_merge is set TRUE, only tags whose original TAD bin breaks included all of the user-specified tad_breaks will be merged in a single group ('merged') based on the new bin breaks, while other tags will be omitted in the output. By contrast, if force_merge is set FALSE, tags that do not contain all specified tad_breaks will be merged in seperate groups (group2, group3, etc.), based on similar bin_breaks.
tat_breaks	a numeric vector defining the bin_breaks for the merging (rebinning) of the TAT frequency data. In case that the additional argument force_merge is set TRUE, only tags whose original TAT bin breaks included all of the user-specified tat_breaks will be merged in a single group ('merged') based on the new bin breaks, while other tags will be omitted in the output. By contrast, if force_merge is set FALSE, tags that do not contain all specified tat_breaks will be merged in seperate groups (group2, group3, etc.), based on similar bin_breaks.
force_merge	If FALSE (default), groups of tags with similar TAD and TAT-bin_breaks will be combined (no merging on new bin breaks) and identifier labels renamed as group1, group2, etc. If set TRUE, TAD and TAT frequency data will be merged on user-specified tad/tat_breaks or, if those arguments are missing, on the bin_breaks that all tags have in common. In both latter cases, identifier labels will be renamed "merged".

Value

A list-of-lists of grouped or merged TAD and TAT frequency data.

$ TAD:List
..$ group1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
$ TAT:List
..$ group1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame

..$ group2 : List of 2

...

## part V - unmerge data:
unmerge_histos(hist_dat_merged)
```

| plot_data_coverage | *Abacus plot to illustrate the data coverage of different data products per tag throughout their deployment period.* |

Description

Abacus plot to illustrate the data coverage of different data products per tag throughout their deployment period.

Usage

```
plot_data_coverage(x, type, type2, meta,
                    Identifier="Serial", fields=c("Serial","Ptt"),
                    date_range_std, show_fullmonths=TRUE,
                    zlim, mars, na.omit=TRUE,
                    do.arrows=TRUE, xpos.arrows=-.25, xpos.years=-.27,
                    xpos.fields=c(-.01,-.12), ypos.fields,
                    main, cex.main=1.2,
                    cb.xlab, cex.cb.xlab=1,
                    cb.ticks, cex.cb.ticks=.9,
                    pal="jet", bg="grey")

abacus_plot(x, type, type2, meta,
            Identifier="Serial", fields=c("Serial","Ptt"),
            date_range_std, show_fullmonths=TRUE,
            zlim, mars, na.omit=TRUE,
            do.arrows=TRUE, xpos.arrows=-.25, xpos.years=-.27,
            xpos.fields=c(-.01,-.12), ypos.fields,
            main, cex.main=1.2,
            cb.xlab, cex.cb.xlab=1,
            cb.ticks, cex.cb.ticks=.9,
            pal="jet", bg="grey")
```

Arguments

x	a list with the tagging data whose data covereage will be illustrated as abacus plot
type, type2	the data type of x ("ts", "lightlocs","tad","tat") and the name of the variable to be plotted: "perc" in case of lightlocation and time series data, "perc_dat" in case of histogram data ("tad", "tat").
meta	a data.frame containing the meta data of the tagging program. Required column names include: 'dep.date', 'pop.date' as well as the definitions of the Identifier, fields vectors (see below).
Identifier	unit vector to identify the tags within the tagging data list (must appear in names of sublist) and meta table (column name). By default 'Serial' of the tag.
date_range_std, show_fullmonths	
	standardized date range to be plotted (deplyoment years are reset to 0; e.g 0-10-03 and 01-02-17 for a fish that was in the water from 2017-10-03 until 2018-02-17. If missing, the date range will be estimated from the tagging data. If show_fullmonths=TRUE, the estimated date range will be rounded to full months (e.g. 0-10-01 and 01-03-01). However, show_fullmonths is ignored if date_range_std is specified.
mars	a numerical vector of the form c(bottom,left,top,right), decribing the number of margin lines to be specified on the each side of the plot. The default is c(5,12,4,8). In case of length(fields) > 2 you may need to increase the space to the left as well as related arguments (i.e. xpos.arrows, xpos.years, xpos.fields),

	in order to provide the neccessary space for the columns of the meta data to be shown.
na.omit	whether missing data points within the time series shall be converted to 0. If FALSE, such missing points will be shaded in grey.
zlim	the minimum and maximum z values for which colors should be plotted. By default c(0,100).

do.arrows, xpos.arrows, xpos.years

whether arrows shall be shown next to the deployment years as well as the horizontal position of arrows and deployment years.

fields, xpos.fields, ypos.fields

vectors to define the column(s) in meta data to be illustrated to the left of the data coverage abacus plot as well as related horizontal and vertical positions.

main, cex.main	the title and it's font size. if missing, title will be set to "type".

cb.xlab, cex.cb.xlab

the title of the colorbar and it's font size.

cb.ticks, cex.cb.ticks

the tick labels of the colorbar and it's font size.

pal, bg	the color palette of the colorbar (either a vector or a single keyword referring to a colorbar from the colorbars of the [oceanmap](#) package) as well as the background color of the data coverage abacus plot. Please note also, that if the argument 'na.omit' is set to FALSE, missing data points will be shaded in grey.

Details

Abacus plot to illustrate the data coverage of different data products per tag throughout their deployment period as shown in Figure 3 of Bauer et al. (2020).

plot_DepthTempTS   *plot Depth Temperature time series data*

Description

line plot for xyz-time series data with colorized z-variable (e.g. depth-temperature time series data
from archival tags).

Usage

```
plot_DepthTempTS(ts_df, y="Depth", z="Temperature",
                    xlim, ylim, zlim, show.colorbar=TRUE,
                    pal="jet", cb.xlab, cb.xlab.line=0,
                    pt.lwd, do_interp=TRUE, Return=FALSE, mars, ...)

plot_DepthTempTS_resampled(ts_df, y="Depth",z="Temperature", bin_res=10,
                              xlim, ylim, zlim, show.colorbar=TRUE,
                               pal="jet", cb.xlab, cb.xlab.line=0,
                               pt.lwd, do_interp=TRUE, Return=FALSE, mars, ...)

plot_DepthTempTS_resampled_PDT(ts_df, PDT, y="Depth", z="Temperature",
                                 xlim, ylim, zlim, show.colorbar=TRUE,
                                 pal="jet", cb.xlab, cb.xlab.line=0,
                                 pt.lwd, do_interp=TRUE, Return=FALSE, mars, ...)
```

Arguments

ts_df,PDT   [data.frames](data.frame) holding the time series data to be plotted, including the x-vector
               'datetime' (in POSIXct-format and UTC), and the numeric y-vector whose la-
               bel is defined by y. In case of plot_DepthTempTS_resampled the depth tem-
               perature time series data will be interpolated on a daily basis and then resam-
               pled for temperature data by the depth records of the original time series data.
               plot_DepthTempTS_resampled_PDT does the same but uses PDT data for re-
               sampling.

y	character label of time series vector to be plotted (by default 'Depth').
z	character label of time series vector to be plotted (by default 'Temperature').
bin_res	specific argument for `plot_DepthTempTS_resampled`: the depth interval at which temperature records should be binned. (by default 10).
xlim	the x limits (x1, x2) of the plot (by default range(ts_df$datetime)).
ylim	the y limits of the plot (by default range(ts_df[[y]])).
zlim	the y limits of the plot (by default range(ts_df[[z]])).
show.colorbar	weather a colorbar should be plotted for image plots (default is TRUE).
pal	color map to be plotted (default is the 'jet'-colormap of the [oceanmap](#)-package. See [cmap](#) for available color maps.
cb.xlab, cb.xlab.line	
	character string indicating the label of the colorbar (default is Temperature in degrees) and `cb.xlab.line` its placement line (default is 0).
pt.lwd	size of points and lines.
do_interp	whether z-values shall be interpolated over the covered range of the time series data. The default `TRUE` value will produce a line plot. If set to FALSE only the available data points of the z-variable will be plotted.
Return	whether edited time series data set should be returned (by default FALSE).
mars	A numerical vector of the form c(bottom, left, top, right) which gives the number of lines of margin to be specified on the four sides of the plot. The default is c(5,4,4,10).
...	additional arguments to be passed to [plot_TS](#).

plot_TS   *plot time series data*

Description

plotting functions for time series data (e.g. depth or temperature time series data from archival tags)
with user specified xtick intervals.

Usage

```
plot_DepthTS(ts_df, y="Depth", xlim, ylim, xticks_interval,
             ylab=y, xlab="Time (UTC)", main, main.line=1, plot_info=TRUE,
             ID, ID_label="Serial",
             plot_DayTimePeriods=FALSE, twilight.set="ast",
             cex=1, cex.main=1.2*cex, cex.lab=1*cex,
             cex.axis=.9*cex, cex.axis2=1*cex,
             type="l", las=1, xaxs="i", yaxs="i",
             plot_box=TRUE, bty="l", Return=FALSE, ...)

plot_TS(ts_df, y="Depth", xlim, ylim, xticks_interval,
        ylab=y, xlab="Time (UTC)", main, main.line=1, plot_info=TRUE,
        ID, ID_label="Serial",
        plot_DayTimePeriods=FALSE, twilight.set="ast",
        cex=1, cex.main=1.2*cex, cex.lab=1*cex,
        cex.axis=.9*cex, cex.axis2=1*cex,
        type="l", las=1, xaxs="i", yaxs="i",
        plot_box=TRUE, bty="l", Return=FALSE, ...)

empty.plot_TS(xlim, ylim, xticks_interval, ylab="", xlab="Time (UTC)", main="",
              cex=1, cex.main=1.2*cex, cex.lab=1*cex,
              cex.axis=.9*cex, cex.axis2=1*cex,
              las=1, xaxs="i", yaxs="i", do_xaxis=TRUE, do_yaxis = TRUE,
              plot_box=TRUE, bty="l", ...)
```

Arguments

ts_df   [data.frame](#) holding the time series data to be plotted, including the x-vector
                 'datetime' (in POSIXct-format and UTC), and the numeric y-vector whose label
                 is defined by y.

y   character label of time series vector to be plotted (by default 'Depth').

xlim	the x limits (x1, x2) of the plot (by default range(ts_df$datetime), but needs to be specified in empty.plot_TS).
ylim	the y limits of the plot (by default range(ts_df[[y]]), but needs to be specified in empty.plot_TS).
xticks_interval	time step of the x-axis ticklabels in (full) hours. By default 3 hours for xlim differences <= 1 day, and 6 hours for differences > 1 day.
ylab, xlab	the y- and x-axis labels.
main, main.line	main title (by default "Tag ID") for the plot and its line (see [mtext](#) for reference).
plot_info	whether the plot title and axes labels should be shown (by default TRUE).
ID, ID_label	Tag ID and its label (column name; by default "Serial") to be selected (e.g. if input data frame holds tagging data from several tags).
type	what type of plot should be drawn. Possible types are:

- ″p″ for points,
- ″l″ for lines (default),
- ″b″ for both,
- ″c″ for the lines part alone of "b",
- ″o″ for both 'overlapped',
- ″n″ for nothing (similar to empty.plot_TS-function call)

las	numeric in 0,1,2,3; the style of axis labels.

0: always parallel
1: always horizontal (default)
3: always perpendicular
4: always vertical
"

xaxs, yaxs	The style of axis interval calculation to be used for the x-and y-axes. Possible values are "r" and "i" (default). The styles are generally controlled by the range of data or xlim, if given.

Style "r" (regular) first extends the data range by 4 percent at each end and then finds an axis with pretty labels that fits within the extended range.

Style "i" (internal) just finds an axis with pretty labels that fits within the original data range.

cex,cex.main, cex.lab, cex.axis, cex.axis2	The standard font size of title, axis labels and tick labels.
plot_DayTimePeriods, twilight.set	whether day-time periods ('Night', 'Dawn', 'Day', 'Dusk') should be plotted as shaded areas. In case that plot_DayTimePeriods is set TRUE), the limits of each time period are required (columns sunrise, sunset, dawn.ast,/dawn.naut and

dawn.ast/dawn.naut in POSIXct-format. In case of the twilight events, the additional argument twilight.set defines the suffix of the twlight-set to be selected ("ast" for astronomical dawn and dusks vs "naut" for nautical twilight events). If any of the day-time columns, described above, is missing, it/they will be calculated based on geolocation estimates (required columns Lon and Lat) through an internal call of function get_DayTimeLimits.

do_xaxis,do_yaxis

Optional arguments in empty.plot_TS to define whether a x and and y-axis shall be plotted (by default TRUE).

plot_box, bty   whether a box of box-type bty should be plotted (by default TRUE. bty is one of "o" (the default), "l", "7", "c", "u", or "]" the resulting box resembles the corresponding upper case letter.

Return   whether edited time series data set should be returned (by default FALSE).

...   additional arguments to be passed to plot.

# plot_DepthTS(ts_df, plot_DayTimePeriods = FALSE, xlim = xlim)

### check xtick time step:
# plot_DepthTS(ts_df, plot_DayTimePeriods = FALSE, xlim = "2016-08-10")
# plot_DepthTS(ts_df, plot_DayTimePeriods = FALSE, xlim = "2016-08-10", xticks_interval = 2)

### add daytime periods during plot-function call and return extended data set
```

```
# ts_df$Lon <- 5; ts_df$Lat <- 43
# plot_DepthTS(ts_df, plot_DayTimePeriods = TRUE, xlim = unique(ts_df$date)[2:3])
# ts_df2 <- plot_DepthTS(ts_df, plot_DayTimePeriods = TRUE, Return = TRUE)
# names(ts_df)
# names(ts_df2)

### add daytime periods before function call
# ts_df_extended <- get_DayTimeLimits(ts_df)
# plot_DepthTS(ts_df_extended, plot_DayTimePeriods = TRUE)
# plot_DepthTS(ts_df_extended, plot_DayTimePeriods = TRUE, twilight.set = "naut")

### introduce data transmission gaps that are then filled internally
### as well as daytime periods based on interpolated Lon & Lat positions
# ts_df_cutted <- ts_df[-c(200:400, 1800:2200), ]
# plot_DepthTS(ts_df_cutted, plot_DayTimePeriods = FALSE)
# plot_DepthTS(ts_df_cutted, plot_DayTimePeriods = TRUE)

### example for empty.plotTS and adding time series data as line:
# empty.plot_TS(xlim="2016-08-10",ylim=c(100,0))
# lines(ts_df$datetime, ts_df$Depth)

### alternative:
# plot_DepthTS(ts_df, xlim=c("2016-08-10","2016-08-12"), plot_DayTimePeriods = TRUE, type='n')
# lines(ts_df$datetime, ts_df$Depth)
```

RchivalTag	*RchivalTag - Analyzing and Interactive Visualization of Archival Tagging Data*

Description

RchivalTag provides a set of functions to analyze and visualize different data products from Archival Tags (Supported Models include amongst others: MiniPAT, sPAT, mk10, mk9 from Wildlife Computers as well as LOTEK PSAT Models LOTEK. Models from other Manufactorers might be supported as well.

- "(Depth) time series data" (See plot_TS, plot_DepthTS, dy_DepthTS, empty.plot_TS)

- "Time-at-Depth (TaD) and Time-at-Temperature (TaT) fequencies" (See ts2histos, merge_histos, hist_tad & hist_tat)

- "Depth Temperature profiles (time series data)" (See plot_DepthTempTS, plot_DepthTempTS_resampled, plot_DepthTempTS_resampled_PDT, interpolate_TempDepthProfiles, get_thermalstrat & image_TempDepthProfiles)

- "PDT (PAT-style Depth Temperature profiles) data" (See read_PDT, interpolate_TempDepthProfiles, get_thermalstrat & image_TempDepthProfiles)

- "visualization of geolocation estimates" (See: ggplot_geopos, ggplotly_geopos)

Details

TaD-/TaT-histogram data

- The package allows to read and calculate standard summary data products (TaD-/TaT-profiles, see above) from recovered or transmitted time series data sets as well as to merge and visualize such summary data products from different tag setups/tagging programs. For more information on these data products, please see: Wildlife Computers (2016).

Depth time series data

- data visualization, optionally highlighting daytime differences (dawn, day, dusk, night).

Depth-temperature time series data

- data visualization and examination of the thermal stratification of the water column (i.e. thermocline depth, gradient and stratification index), based on previously interpolated. The paper by Bauer et al. (2015) is highly recommended in this context.

Depth-temperature time series data

- data visualization and examination of the thermal stratification of the water column (i.e. thermocline depth, gradient and stratification index), based on previously interpolated. The paper by Bauer et al. (2015) is highly recommended in this context.

interactive geolocation vizualiation

- data visualization via ggplot2 and plot_ly based on oceanmap standard maps.

Compatibility

So far, the package is mainly adapted for archival tagging data from Wildlife Computers, but can also be applied to data from other tag manufacturers (e.g. see ts2histos in order to calculate TaD & TaT-frequencies from time series data). Function examples are based on the transmitted data sets of a miniPAT-tag from the BLUEMED-project `http://bluemed-project.com/`, funded by the French National Research Agency (ANR; `http://www.agence-nationale-recherche.fr`).

read_histos   *reads a TAD/TAT-histogram file from archival tags*

Description

reads or posttreats a manually loaded standard histogram data file, containing Time-at-Depth (TAD) and Time-at-Temperature (TAT) frequency data, from archival tags by Wildlife Computers.

Usage

```
read_histos(hist_file, date_format, lang_format="en", tz="UTC", dep.end, Serial,
            force_24h=TRUE, min_perc, omit_negatives=TRUE, right_truncate=TRUE)
```

Arguments

hist_file   character string indicating the name of a standard Wildlife Computers file to read
                   or the data.frame of a manually loaded histogram data file. The combination of
                   the columns DeployID, Ptt and Serial is assumed to provide an unique key to
                   distinguish data from indiviudal tags.

force_24h   whether histogram data with a time step of less than 24h should be merged to
                   24h (default is TRUE). Note that the current version of hist_tad and hist_tat was
                   written for 24h data!

date_format, lang_format, tz
                   character strings indicating the date format, language format and the correspond-
                   ing time zone, defined by the vectors Date and Time (by default: date_format="%H:%M:%S
                   %d-%b-%Y", lang_format="en", tz='UTC') If formatting fails, please check as
                   well the input language format, defined by lang_format (and use abbrviations
                   such as "en" for English,"es" for Spanish, "fr" for French, etc.) as well.

dep.end   Date specifying the deployment end of the tag.

Serial   character-string indicating the Serial number of the tag to be selected. (in case
                   of multi-tag histogram files.)

min_perc   optional number, defining the minimum data coverage (in percent) of histogram
                   entries obtained from depth time series data.

omit_negatives   merge negative depth and temperature bins with next positive bin (>= 0; default
                   is TRUE).

right_truncate   truncate the values of the last tat- and tad-bin to 45 degrees and 2000 m, respec-
                   tively (default is TRUE).

Details

This function reads or posttreats a manually loaded standard Wildlife Computers histogram file in-
cluding Time-at-Depth (TAD) and Time-at-Temperature (TAT) frequency data. In the post-treatment,
the histogram data is split in lists of TAD and TAT per individual (see below). Thus processed data
from several histogram files (or similarly processed time series data) can be combined using the

function [combine_histos](#). Merging of histogram data from several tags, based on similar or user-specified TAD and TAT-bin_breaks, can be done by applying function [merge_histos](#). To generate TAD/TAT histogram data from depth and temperature time series data, see [ts2histos](#).

Value

A list-of-lists containing the loaded histogram data. Lists of TAD and TAT data are distinguished at the first nesting level. Further sublists include the bin_breaks and [data.frame](#)s of the histogram data per tag (ID). Tag IDs are constructed based on the columns DeployID, Ptt and Serial keys (e.g. DeployID.101_Ptt.102525). **The data.frames of the histogram data also contain average (avg) and standard deviation (SD) of depth and temperature values that are estimated internally from the TAD and TAT data sets (not measured!). The accuracy of these estimates thus depends on the number and selection of bin breaks**, unlike [ts2histos](#)-generated values that are directly estimated from time series data. See statistics-example below.

$ TAD:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
.. .. ..$ DeployID
.. .. ..$ Ptt
.. .. ..$ datetime
.. .. ..$ date
.. .. ..$ Bin1
.. ..$ Bin? (up to number of bin breaks)
.. .. ..$ avg (average depth estimated!! from histogram data)
.. .. ..$ SD (average depth estimated!! from histogram data)

$ TAT:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame (with columns as above)
..$ ID2 : List of 2
...

# abline(h=20,lty="dashed",col="violet",lwd=3)
```

---

read_PDT   *read PDT data from archival one or multiple tags*

Description

reads PDT data (PAT-style Depth Temperature profiles) from archival tags by Wildlife Computers).
The PDT file can contain data from one or multiple tags.

What are PDTs?
PDT data provides minimum and maximum water temperatures during a user-programmed interval
(usually 24h) at 8 to 16 depths. The sampled depths are thereby rounded (binned) to multiples of 8
and include the minimum and maximum depth bins as well as the 6 to 14 most frequent depth bins
at which the tagged animal was located. The total number of depth bins (8 or 16) also depends on
the tagged animals' behaviour. If the animal was in waters deeper than 400 m during the summary
data period, the range of temperature at 16 depth bins will be reported, otherwise 8.

Why using PDT data?
Despite its low resolution, PDT data can give accurate information on the in-situ thermal stratifi-
cation of the water column (e.g. thermocline depth, stratification index, ocean heat content) ex-
perienced by the tagged animal, as illustrated by Bauer et al. (2015). Accordingly, PDT data can
provide precious insights into the relations between animal behaviour and environmental condi-
tions. See the example section below on how to obtain thermal stratification indicators of the water
column from PDT data.

For instance, daily PDT data can be interpolated and then visualized using functions interpo-
late_PDTs and image_TempDepthProfiles, respectively. This faciliates the analysis of temporal
changes of temperature profiles, for instance, in relation to animal behaviour (e.g. diving be-
haviour).

Usage

```
read_PDT(pdt_file, folder, sep=",",date_format,tz="UTC")
```

Arguments

`pdt_file`	character string indicating the name of a standard PDT-file. The Date-vector of the file is expected to be or the format "%H:%M:%S %d-%b-%Y, tz='UTC'".
`folder`	path to pdt-file.
`sep`	the field separator character. Values on each line of the file are separated by this character (default is ',').
`date_format,tz`	character strings indicating the date format and the corresponding time zone of the histogram file, defined by the vectors Date and Time (by default: date_format="%H:%M:%S %d-%b-%Y, tz='UTC'")

Value

A [data.frame](#) with the columns:
"pdt_file", "DeployID", "Ptt", "NumBins", "Depth", "MinTemp", "MaxTemp", "datetime", "date", "MeanPDT"
Attention: Column "MeanPDT" is not measured but calculated as the average of "MinTemp" and "MaxTemp" values.

Examples

```
## step I) read sample PDT data file:
path <- system.file("example_files",package="RchivalTag")
PDT <- read_PDT("104659-PDTs.csv",folder=path)
head(PDT)

## step II) interpolate average temperature fields (MeanPDT) from PDT file:
# m <- interpolate_PDTs(PDT)
# str(m)
# m$sm

## step III) calculate thermal stratifcation indicators per day (and tag):
# strat <- get_thermalstrat(m, all_info = TRUE)
# strat <- get_thermalstrat(m, all_info = FALSE)

## step IV) plot interpolated profiles:
```

```
# image_TempDepthProfiles(m$station.1)
```

---

read_TS   *reads Time Series Data from Archival Tags*

Description

reads Time Series Data (e.g. Depth and Temperature) from Archival Tags (Supported Models:
MiniPAT, sPAT, recovered mk10, mk9 from Wildlife Computers as well as LOTEK PSAT Models
LOTEK. Models from other Manufactorers might be supported as well.

Usage

```
read_TS(ts_file, header=TRUE, sep=",", skip = 0,
        date_format, lang_format = "en", tz = "UTC")
```

Arguments

ts_file	character string indicating the name of a standard Wildlife Computers file to read or the data.frame of a manually loaded histogram data file. The file is assumed to include the columns Day, Time (or a preformatted date-time vector termed datetime in "UTC" format.) as well as at one of the subsequent columns DeployID, Ptt and Serial to distinguish data from indiviudal tags.
header	a logical value indicating whether the file contains the names of the variables as its first line. If missing, the value is determined from the file format: header is set to TRUE if and only if the first row contains one fewer field than the number of columns.
sep	the field separator character. Values on each line of the file are separated by this character. If sep = "" the separator is 'white space', that is one or more spaces, tabs, newlines or carriage returns.
skip	integer: the number of lines of the data file to skip before beginning to read data.
date_format, lang_format, tz	
	character strings indicating the date format, language format and the corresponding time zone, defined by the vectors Date and Time (by default: date_format="%d-%b-%Y %H:%M:%S", lang_format="en", tz='UTC') If formatting fails, please check as well the input language format, defined by lang_format (and use abbrviations such as "en" for English,"es" for Spanish, "fr" for French, etc.) as well.

Details

This function reads a time series data file from archival tags. Data sets are "completed" to facilitate
an assessment of the data coverage (i.e. by ts2histos or hist_tad).

Value

A data frame (data.frame) containing a representation of the data in the file.

Examples

```
### load sample depth and temperature time series data from miniPAT:
ts_file <- system.file("example_files/104659-Series.csv",package="RchivalTag")
ts_df <- read_TS(ts_file)
head(ts_df)

## other date_format:
ts_file2 <- system.file("example_files/104659-Series_date_format2.csv",package="RchivalTag")
# ts_miniPAT2 <- read_TS(ts_file2) # run to see error message
ts_miniPAT2 <- read_TS(ts_file2,date_format = "%d-%m-%Y %H:%M:%S")
head(ts_miniPAT2)

## other date_format and lang_format:
ts_file_ES <- system.file("example_files/104659-Series_date_format_ES.csv",package="RchivalTag")
# ts_miniPAT_ES <- read_TS(ts_file_ES) # run to see error message
ts_miniPAT_ES <- read_TS(ts_file_ES,skip=1,sep=";",header = TRUE,
                         date_format = "%d/%b/%y %H:%M:%S",lang_format = "es")
head(ts_miniPAT_ES)

## load same data in LOTEK format
ts_file <- system.file("example_files/104659_PSAT_Dive_Log.csv",package="RchivalTag")
ts_df <- read_TS(ts_file,date_format="%m/%d/%Y %H:%M:%S")
head(ts_df) ## attention no identifier (Ptt, Serial, DeployID) included!
ts_df$DeployID <- ts_df$Ptt <- "104659"

## example 1) convert only DepthTS data to daily TaD frequencies:
tad_breaks <- c(0, 2, 5, 10, 20, 50, 100, 200, 300, 400, 600, 2000)
tat_breaks <- c(10,12,15,17,18,19,20,21,22,23,24,27)

histos <- ts2histos(ts_df, tad_breaks = tad_breaks, tat_breaks = tat_breaks)
histos$TAD$merged$df$nperc ## check completeness of TAD data sets
histos$TAT$merged$df$nperc ## check completeness of TAT data sets
# histos <- ts2histos(ts_df, tad_breaks = tad_breaks, tat_breaks = tat_breaks,min_perc = 90)

### example 2) add daytime (Day vs Night) information and plot results
# add daytime periods during plot-function call and return extended data set
# ts_df$Lon <- 5; ts_df$Lat <- 43
# plot_DepthTS(ts_df, plot_DayTimePeriods = TRUE, xlim = unique(ts_df$date)[2:3])
```

```
# ts_df2 <- plot_DepthTS(ts_df, plot_DayTimePeriods = TRUE, Return = TRUE)
# names(ts_df)
# names(ts_df2)

### add daytime periods before function call
# ts_df_extended <- get_DayTimeLimits(ts_df)
# plot_DepthTS(ts_df_extended, plot_DayTimePeriods = TRUE)
# plot_DepthTS(ts_df_extended, plot_DayTimePeriods = TRUE, twilight.set = "naut")
```

resample_PDT	*resample temperature at depth data from interpolated daily temperature at depth profiles or time series data*

Description

interpolates depth-temperature data from a provided source (depth-temperature time series data or PDT data) and resamples the interpolated data by the depth time series data provided, to faciliate plot_DepthTempTS-plots even for tags with no temperature time series data or to improve interpolation results of the plot_DepthTempTS-plots from low-resolution depth-temperature time series data.

Usage

```
resample_PDT(ts_df, PDT, ...)
resample_DepthTempTS(ts_df, ...)
```

Arguments

ts_df	ts_df is a data.frame with depth-temperature time series data data or only depth time series data. Required columns are Depth for the depth data and a column containing temperature data, whose name is defined by Temp_field, by default Temperature.
PDT	an optional data.frame containing PDT-data from read_PDT.
...	additional arguments to be passed to interpolate_TempDepthProfiles, or interpolate_PDTs.

Value

a data.frame with depth-temperature time series data.

ts_df <- read_TS(ts_file)
head(ts_df)

## run daily interpolation of depth temperature time series data
m <- interpolate_TempDepthProfiles(ts_df)
image_TempDepthProfiles(m$station.1)
ts_df2 <- resample_DepthTempTS(ts_df) ## reassign temperature at depth values

## read PDT data from same tag
## (= low resolution depth temperature data (8 Depth and Temperature records per day))
path <- system.file("example_files",package="RchivalTag")
PDT <- read_PDT("104659-PDTs.csv",folder=path)
head(PDT)

m <- interpolate_PDTs(PDT) ## interpolate PDTs
image_TempDepthProfiles(m$station.1)
ts_df3 <- resample_PDT(ts_df, PDT) ## reassign temperature at depth values

#### plot results:
## 1) dot plots:

## dot plot of RECORDED depth temperature time series data
## plot_DepthTempTS(ts_df, do_interp = FALSE)

## dot plot of RESAMPLED depth temperature time series data
## from previously daily interpolated depth temperature time series data
# plot_DepthTempTS(ts_df2, do_interp = FALSE)

## dot plot of RESAMPLED depth temperature time series data
## from daily interpolated PDT data (external resampling)
# plot_DepthTempTS(ts_df3, do_interp = FALSE)

## dot plot of RESAMPLED depth temperature time series data
## from daily interpolated PDT data (internal resampling)
# plot_DepthTempTS_resampled_PDT(ts_df, PDT, do_interp = FALSE)
```

```
## 2) line plots:

## line plot of depth temperature time series data
## (internal interpolation between neighboring temperature records)
## not recommended for low resolution time series data
# plot_DepthTempTS(ts_df, do_interp = TRUE)

## line plot of depth temperature time series data
## (based on internal daily interpolated depth temperature time series data)
# plot_DepthTempTS_resampled(ts_df, do_interp = TRUE)

## line plot of depth temperature time series data
## from daily interpolated PDT data (external resampling)
# plot_DepthTempTS(ts_df3, do_interp = TRUE)

## line plot of depth temperature time series data
## from daily interpolated PDT data (internal resampling)
# plot_DepthTempTS_resampled_PDT(ts_df, PDT, do_interp = TRUE)
```

---

resample_TS   *resample time series data at a lower resolution*

Description

resample time series data at a lower resolution

Usage

```
resample_TS(df, tstep)
```

Arguments

df	data.frame holding the time series data to be resampled, including a 'datetime'-vector (in POSIXct-format and UTC).
tstep	numeric vector indicating the resampling resolution (in seconds).

Author(s)

Robert K. Bauer

ts2histos	*convert depth and temperature time series data to discrete Time-at-Depth and Time-at-Temperature data (histogram data)*

Description

convert depth and temperature time series data to discrete Time-at-Depth (TaD) and Time-at-Temperature (TaT) data (histogram data) at user-defined breakpoints

Usage

```
ts2histos(ts_df, tad_breaks=NULL, tat_breaks=NULL, split_by=NULL,
          aggregate_by="Ptt",min_perc, omit_negatives=TRUE)
```

Arguments

ts_df	dataframe of depth time series data. Obligatory columns are the numeric vector "Depth", "date" (of class Date) and "Serial". split.by defines an optional vector to consider (e.g. day.period).
tad_breaks, tat_breaks	
	a numeric vector, defining the depth and/or temperature breakpoints of the histogram cells.
split_by	Name of the column with logical entries by which TaD/TaT data shall be splitted (e.g. daytime; see classify_DayTime.).
aggregate_by	character vector defining the columns by which the tagging data should be aggregated. Should contain columns that identify tags (e.g. Serial, Ptt, DeployID) the date and/or day time period (to seperate records from night, day, dawn and dusk see classify_DayTime). Default values are: date, Day and Ptt.
min_perc	optional number, defining the minimum data coverage (in percent) of histogram entries obtained from depth time series data.
omit_negatives	treat negative depth and temperature records as 0 (default is TRUE).

Details

Time-at-Depth and Time-at-Temperature fequencies (histograms) are a standard data product of archival tags (incl. tag models TDR-Mk9, PAT-Mk10 and miniPAT by Wildlife Computers) that allow to assess habitat preferences of tagged animals. It can be likewise generated from transmitted or recovered time series data sets, which is the purpose of this function.

However, different depth and temperature bin breaks are often used during different deployment programs, which makes a later comparitive analysis of TaT and TaD data difficult. For such cases, the functions combine_histos and merge_histos can be applied to merge TaT and TaD frequencies based on common bin breaks of different tags.

To visualize Time-at-Temperature (TaT) and Time-at-Depth (TaD) data, please see hist_tat and hist_tad, respectively.

Value

A list-of-lists containing the loaded histogram data. Lists of TaD and TaT data are distinguished at the first nesting level. Further sublists include the bin_breaks and data.frames of the generated histogram data. **The data.frames of the histogram data thereby also contain average (avg) and standard deviation (SD) of depth and temperature values that are likewise directly estimated from time series data**, unlike read_histos-generated values that are estimated from the histogram data. The accuracy of latter estimates thus depends on the number and selection of bin breaks (see statistics-example in read_histos).

$ TaD:List
..$ merged : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
.. .. ..$ DeployID
.. .. ..$ Ptt
.. .. ..$ datetime
.. .. ..$ date
.. .. ..$ Bin1
.. ..$ Bin? (up to number of bin breaks)
.. .. ..$ avg (average depth estimated!! from histogram data)
.. .. ..$ SD (average depth estimated!! from histogram data)

$ TaT:List
..$ merged : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame (with columns as above)

## example 2) rebin daily TaD frequencies:
tad <- ts2histos(ts_df, tad_breaks = tad_breaks)
tad2 <- rebin_histos(hist_list = tad, tad_breaks = tad_breaks[c(1:3,6:12)])
par(mfrow=c(2,2))
hist_tad(tad, do_mid.ticks = FALSE) ## example for multiple individuals
hist_tad(tad$TAD$merged, do_mid.ticks = FALSE)
hist_tad(tad$TAD$merged, bin_breaks = tad_breaks[c(1:3,6:12)]) ## from inside hist_tad
```

---

unmerge_histos	*unmerge previously grouped or merged lists of TAD/TAT frequency data*

Description

This function unmerges previously grouped or merged lists of TAD/TAT frequency data, and thus allows to add TAD/TAT lists from new tags (see combine_histos).

Usage

```
unmerge_histos(hist_list)
```

Arguments

hist_list   A previously grouped or merged list-of-lists to be unmerged (seperated by tags).

Value

A list-of-lists of ungrouped/unmerged TAD and TAT frequency data.

$ TAD:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
$ TAT:List
..$ ID1 : List of 2
.. ..$ bin_breaks: num
.. ..$ df : data.frame
..$ ID2 : List of 2
...

Examples

```
## example 1) read, merge and plot TAD frequency data from several files:
## part I - read histogram data from two files:
hist_dat_1 <- read_histos(system.file("example_files/104659-Histos.csv",package="RchivalTag"))
hist_dat_2 <- read_histos(system.file("example_files/104659b-Histos.csv",package="RchivalTag"))
## note the second list is based on the same data (tag), but on different bin_breaks

## part II - combine TAD/TAT frecuency data from seperate files in one list:
hist_dat_combined <- combine_histos(hist_dat_1, hist_dat_2)
par(mfrow=c(2,1))
hist_tad(hist_dat_combined)
hist_tat(hist_dat_combined)

## part III - force merge TAD/TAT frecuency data from seperate files
# in one list, by applying common bin_breaks:
```

```
hist_dat_merged <- merge_histos(hist_dat_combined,force_merge = TRUE)
hist_tad(hist_dat_merged)
hist_tat(hist_dat_merged)

## part IV - plot merged data:
hist_tad(hist_dat_merged) # of all tags
unique(hist_dat_merged$TAD$merged$df$DeployID) ## list unique tags in merged list
hist_tad(hist_dat_merged, select_id = "15P1019b", select_from = 'DeployID') # of one tag

## part V - unmerge data:
unmerge_histos(hist_dat_merged)
```
